## a \$16 pocket spectrum analyzer

**ShmooCon** was, once again, a fantastic experience this year. One of many highlights of this year's event for me was hacking on some radio devices with [Travis Goodspeed](#) in the hotel bar for hours on end. This included playing with the [IM-Me](#) that he brought. As soon as I got home I ordered one. I found mine for \$15.99 and free shipping on eBay.

Since then I've written custom firmware to turn my IM-Me into a pocket spectrum analyzer, shown here displaying activity of a frequency hopping system at a grocery store. The only change I've made to the hardware is the addition of a ribbon cable in order to easily connect to a [GoodFET](#) for programming, but this is simply creating a permanent connection to the debug [contact points](#) that are already exposed in the battery compartment. I've followed [Travis's advice](#) on how to develop for the platform.

The software tunes the IM-Me's radio chip to one frequency at a time, uses the chip's RSSI measurement function, and plots the result as one column on the LCD. It sweeps across the whole screen (132 columns) several times per second, showing a contiguous range of radio frequency activity. The

technique works quite well, although there are a few defects. Most notably, harmonics of the IM-Me's 26 MHz crystal show up as spurs on the display.

The frequency ranges supported by my device are 281 - 361, 378 - 481, and 749 - 962 MHz. This is about 50% more than the chip is advertised to support and covers quite a bit of interesting activity in the US including ISM, LMR, television, amateur bands, pagers, and mobile phones. The edges of the bands supported by other batches of chips may differ but probably not by much.

The software supports three bandwidth modes: wide (default), narrow, and ultrawide. Wide mode displays 26.4 MHz of bandwidth in 200 kHz increments. Narrow mode displays 6.6 MHz of bandwidth in 50 kHz increments. Ultrawide mode, shown here with some

mobile phone activity, displays 88 MHz of bandwidth in 667 kHz increments.

The code is open and available [here](#). I'd love to hear from you if you give it a try. Huge thanks to both [Travis](#) and [Dave](#) who did the hard reverse engineering work!

**Update:** The code has a new home at [github](#).

Beautiful work, Mike (and Travis and Dave). Repurposing mass-produced hardware and packaging for more interesting applications is so slick. I'm going shopping for a few IM-Mes, I think...

**Nate Klafstik** said...  
Hello, I am an amateur radio operator. Could this be tuned to a frequency and demodulated on the device to use as a receiver? and also, could an external antenna be used with the spectrum analyzer?

Thanks, Nathanael.

10:39 AM

**Michael Ossmann** said...  
Hey, Nate. Yes, demodulation can be done on the device for certain signals. Several variations of ASK and FSK are supported. See the cc1110 data sheet for details. It wouldn't be difficult to add an external antenna connector. The built-in antenna is a piece of wire (900 MHz quarter wave monopole) inside the case along the top of the LCD.

**bscogg** said...  
Hello everyone.

Do you think this would be possible with the original Zipit in the 2.4GHz spectrum? I have access to thousands at about this same price point.

Thanks in advance,  
Brad

**Anonymous** said...  
Although you said that it supports bands at 200 or 300MHz, the balun network of the device is likely only meant for one of these bands. Is performance degraded by this?

12:27 PM

**Michael Ossmann** said...  
Yes, the balun (not to mention the antenna) is designed for 900 MHz, so the lower bands do not perform as well. They also suffer more from internal interference. Still, I did some testing in all three bands, and it is useful even down at the low end.

I don't think a similar hack would be possible on the Zipit as it uses a 802.11 chip. If you find a device with a cc2530 or similar, though, let me know. :-)

**Sebastiano** said...  
Nice indeed Michael, I had been trying to refrain from buying a cheap IM-ME from eBay... don't think I'll succeed in refraining any longer now!

As to spurious response from the 26 MHz XTAL, wouldn't it be possible to implement a sort of calibration routine in software?

Something like:  
- disable the antenna input of the radio IC  
- measure exact frequency of the XTAL  
- calculate exact harmonic freqs. of the XTAL  
- measure RSSI outputs on those harmonic freqs. and write them to memory  
- re-enable the antenna input of the radio IC  
- at last modify the spectrum analyzer firmware so that the values of harmonics get subtracted from actual measurements taken on those same harmonics.

Just an idea, and beware that I'm no software engineer... so please don't laugh if this sounds as a dumb proposition.

Cheers,  
S.

Nice job Michael. I have ordered a IM-ME from ebay. But I wonder how to flash it with common tools/programmers. Any chance to program it using a PIC, AVR, or simillar programmer? I'm not very familiarized with JTAG capabilities and GoodFET does not seem to be easily available. Any ideas?

Thank you!

5:29 PM

**Michael Ossmann** said...  
I like the way you are thinking, Sebastiano, but there are drawbacks to your proposal.

If we normalize the output by subtracting the response without an antenna, then we show a reduced power level for signals at the same frequency as our spurs. For example, if we have a 10 dB spur from internal interference at 910 MHz and a 15 dB signal is detected, we would display it at 5 dB instead of 15 dB. You could argue that masking signals below 10 dB is also a problem, but at least there is an indication to the user that masking could occur. I'd rather have a visible defect than an invisible one. As an alternative, it might be worth trying to add some better internal shielding. The 26 MHz crystal is right next to the antenna path.

Frequency calibration would be nice too, but the only internal reference we have to measure the crystal is the crystal itself. It always appears to be perfect! We could calibrate to an external RF signal, but I haven't thought of a good one that would be available to most people. Something like [WVVB](#) would be nice, but it would have to be within the frequency range of the IM-Me.

Defaultito: I highly recommend the GoodFET. Travis is in the habit of handing out bare boards for free everywhere he goes (say, [SOURCE Boston](#)). The hardware is open source, so you could have boards printed yourself if you want. You could also build or buy a [CC Flasher](#) or a [TL Development Kit](#). The serial debug protocol is well documented and could be implemented on other hardware. The Bus Pirate would be a good candidate. Travis's blog has some [info](#) that would be helpful if you wanted to try that.

10:45 PM

**Defaultito** said...  
Thnak you Michael! Since I usually work with AVR, I will try to build a CC Flasher. It would be nice to have a yahoo group or forum for all interested in turn the IM-ME into a handheld spectrum analyzer. Many hams would be interested!

5:59 AM

**Sebastiano** said...  
Michael, your points seem definitely reasonable. Maybe XTAL harmonics could be reduced by removing the internal antenna (cutting PCB traces I suppose), and replacing it with a thin coax pigtail. Extra shielding for the XTAL would certainly help as well.

I'll have to experiment - in the end I surrendered to the temptation and ordered a cheap IM-ME :)  
An external antenna connector would also be useful for connecting attenuators, signal generators etc.  
Finally: a friend will be able to lend JTAG->USB interfaces (based on Atk Pioneer or Prologic chips). I hope one of this interfaces will be able to load your firmware on the IM-ME. I'll let you know...

Ewww... What kind of person puts his grubby pocket device that's been god-knows-where on everyone's belt peppers like that?

4:22 PM

**Anonymous** said...  
I assume the companion USB dongle also contains a CC1110 and that comparable tricks might be possible from the PC side?

9:28 PM

**Michael Ossmann** said...  
I would have expected the dongle to contain a CC1111, but it has a CC1110. See [Joby's blog](#) for some great info.

10:25 PM

**Lawz** said...  
Can this gizmo display FM analogue signals too, or just digitally modulated signals?

11:09 AM

**Michael Ossmann** said...  
Lawz: it will detect any radio signal in the supported frequency range. The modulation doesn't matter. I'm not doing any demodulation or decoding here.

9:25 PM

**qrp-saijin** said...  
Is this idea adaptable for HF? I'm thinking something like a mixer with a 280 MHz LO to convert the entire HF spectrum 0-30 MHz to 280-310 MHz, plus a lowpass filter to remove the image response. I'm interested in measuring the harmonics of a homebrew 7 MHz CW rig.

Also, what's the dynamic range?

9:40 AM

**conundrum** said...  
It ought to be possible to hack this for WiFi using a simple mixer and L.O. to downconvert the 2.4 to 2.5 GHz band (and for that matter any other band all the way up to 15 GHz i.e. satellite TV) into a suitable band.

Ghetto TCXO can be made using any old cheap 433MHz xtal or other oscillator, tap off the 2nd harmonic at 866 MHz and use temperature feedback circuit :-)

5:16 AM

**conundrum** said...  
Sorry, that should be 3rd harmonic at 1732 MHz, leaving a difference frequency centred on 668 MHz at 2400 MHz and 768 MHz at 2500 MHz.

A simple tuned circuit bandpass filter would do the trick here.

5:29 AM

**Anonymous** said...  
I want to build a POCASAG receiver from the im-me. This should be super fun.

3:29 AM

**Gary VK2kyp** said...  
Hi you please tell me which ebay dealer you got your IM-Me from?  
I am also aHam Radio operator  
Thank you  
regards Gary VK2KYP

12:51 AM

**Gary VK2kyp** said...  
Hi, can you please tell me the ebay seller you brought your IM-ME from? I am also a ham radio operator  
regards Gary VK2KYP

12:55 AM

**Xio Goering** said...  
Gary you can still buy it via Amazon, I just bought one.

Speaking of which I was curious if the device could be flashed with the bus pirate? The device is 3.3v tolerant. And I've wired it to my bp and been able to supply it power. However that's as far as I've gotten. Any ideas?

11:11 AM

**VK2WAR VK2WAR** said...  
Hi guys,

Now Im feeling left out!!! How brilliant you all are. Im looking for one myself. As an Aussie Ham Im crossing my fingers someone on Amazon will sell me one. (hard to find anyone on Amazon willing to ship to Australia).

Jason
